Search Notes

Dear Examiner Nguyen,

Attached please find the results of your search request for application 10/007619. I searched Dialog's patent files, technical databases and general files; along with the Internet, IEEE, ACM and IBM's TDBs.

Please let me know if you have any questions.

Regards,

Geoffrey St. Leger
4B31/x23540

  Detailed Description

Detailed Description
... in the intermediate language which call for percentage calculations or
  otherwise require two separate passes of the **database** (i.e.
  comparisons). The types of queries that Query Assistant 10 can produce
  that require a CREATE...

...SQL statement elements including: SELECT columns,
  WHERE clauses, ORDER BY columns, GROUP columns, Having clause flag,
  FROM **table / alias** pairs, **JOINs** . In this step, the SELECT, and ORDER
  BY sections
  3o are populated, but WHERE clauses are maintained...is why virtual
  column expressions are defined according to SQL expressions or other
  expressions understood by the **DBMS** . In this step, the expression of a
  virtual column will be added to the WHERE clause -- a Lookup command will
  simply make another **join** condition in the WHERE clause.

In step 428, the FROM clause of the SQL statement is created by assigning
  aliases for each **table** in the SELECT and WHERE clauses, but ignoring
  subqueries that are defined during the pattern matching of...
...clauses with their respective column order numbers.

In step 432, the navigation path is computed for required **joins** . This
is done
using a minimal spanning tree as described above. This is a technique
commonly used for finding the shortest **join** path between two tables,
but other techniques will work equally well. If additional tables are
required then they are added. Also, by default, the shortest **join** path
is created. However, if the user designated a different **join** path which
was predefined by the administrator and put in the conceptual layer, that
path is used...

...they are added in step 436 to the FROM clause. Then, in step 438, the
  WHERE clause **join** statements are created in the internal SQL structure.

In step 440, SELECT is converted to SELECT DISTINCT...CONSTR1 !VAL1
Pattern 654
/* and count (DISTINCT x) > 500
COUNT (DISTINCT!ATT1) !NUM-CONSTR1 !VAL1 0
FROM **TABLE** 1ATT1 ! **ALIAS1**
WHERE COUNT (DISTINCT !ALIAS1 . COL!ATT1) !NUM-CONSTR1 !VAL1
Pattern 655

```
/* and count (x) > 500
COUNT (!ATT1 ) 1NUM-CONSTR1 !VAL1 0
FROM TABLE !ATT1 ! ALIAS1
WHERE COUNT (!ALIAS1 . COL!ATT1 )!NUM-CONSTR1 !VAL1
Pattern 656
/* show names of customers with ytd sales...
```

...pattern matcher is recursively called when it encounters nested Where
clauses in the case of parentheticals.

C. **Join** Path
Steps 432 - 436 call for the computation of **join** paths,'the addition of
any new tables to the FROM clause, and inclusion of the explicit **joins**
'in the WHERE clause. The computation of the **join** paths will produce
the shortest **join** path between two tables unless the administrator has
defined alternate **join** paths in the conceptual layer for the user to
choose from. With a **database** structure as shown in Fig. 6, where the
direction of the arrows show primary key -> foreign key...is the common
LDT.

Using the above procedure, the following table can be constructed for the·
3o **database** of Fig. 6.
66
Primary table Foreign table Next Table Number of
Joins
SALESPEOPLE CUSTOMERS 1
SALESPEOPLE...

...io conceptual layer, the SQL generator will use the shorter path.

As another example, to find the **join** path from ORDERS to PRODUCTS, the
navigable paths are first computed in the same way. This yields...

...Following the table from ORDERS
1 5 to LINE ITEMS and then back up to PRODUCTS, the **join** path [ORDERS
LINE -ITEMS PRODUCTS] is computed. This technique is one of several well
know in the art and calculation of the **join** path is not limited to this
technique in the present invention.

In the last example above, the LINE-ITEMS table is introduced in creating
the **join** path. Step 436 adds any new tables introduced in the process
of
calculating the **join** path to the FROM clause in the internal SQL
structure. Also included is an **alias** for the new **table** .
SQL requires the **joins** to be explicitly provided in the WHERE clause,
and step 436 implements this. The primary and foreign...

...user. Using the information, the following statement can be included in
the WHERE clause to express the **join** of the above ex-ample if the alias
for ORDERS,
PRODUCTS and LINE.NUMBERS is T1, TZ...

  Detailed Description

Detailed Description

... from previous queries.

The post-processing is implementation dependent and may vary based on the actual relational **database** management system being used. The statements shown here are appropriate when using an Oracle **database** with the default cost-based query optimizer.

The code shown in the example for step 502 applies to hierarchical dimensions. For non-hierarchical dimensions the code will be replaced by code **joining** with implementation dependent tables in order to express the generality indicated in the dimensional focus specification.

The...the code for the actual query.

In a first step 601 a query is prepared with basic **joins** and aggregated select.

Following that, for each focused dimension (i.e. for each structural identity value (struct -id) in the query focus table (queryjocus)), code is added 602 to **join** with
aliases for the connection **table** (dim-Conn) and the query focus table (query
focus). When all the focused dimensions have been gone...

...value in
the query group table (query
group) is gone through, and code is added 603 to **join**
with an alias for the query group table (query
group) and to select and group by
group...

...utilizing the query focus table (query
focus) for dimensions with a limited number
of focused items, while **joining** directly with dimensional item table
(dim -item) and the dimensional hierarchy table (dim-hier) for dimensions
where...

...a number of queries focusing on the same dimensions were performed. Four queries were based on traditional **joins** with the complete tables of the
database , in this case the dimensional hierarchy table (dim- hier) and
the dimensional item table (dim-item), and five were based on **joins**
with **aliases** for the working **tables** described above (query
f6cus, query
group).

The following table shows the results for completing the various queries.

Number of dimensions Query with **join** towards Query with **join** towards
selected for focusing and aliases for dim-hier and aliases for query
f6cus
grouping dim-item...

Detailed Description
... ordered similarly.

  Booster Engines. In a WHERE clause, if the selected condition predicate
  would cause the Oracle **RDBMS** to perform a non-indexed search, a
  secondary condition predicate is added to first perform an indexed...

...also reduces the number of records which must be manipulated and checked
for the case-insensitive comparison.

  Table   Aliases . The system prefers to use **table   aliases** and to
prefix column names with their aliases whenever there is more than one

table specified in...

...is preferred to the DISTINCT construct, the WHERE construct is preferred to the HAVING construct, and table joins are preferred to sub-queries.

1 5
NOT and OR Operators. The system prefers to avoid WHERE clauses which use a negated operator, such as NOT EQUALS, because the Oracle **RDBMS** performs a nonindexed table scan in these case.

Similarly, in a WHERE clause which has multiple index...examines the query model 260, the list of query model objects 992, the alias records 993, the **join** records 994, and the condition records 995, and in response, generates SQL commands 261 using the form...

...9-3 includes a <results> section for specifying the form of the query results 25 1, a < **tables** and **aliases** > section for specifying the tables in the relational database 250 to be searched, a < **JOIN** of tables> section for specifying how the tables to be searched are joined, and a <conditions> section...

...commands 261 would thus begin with a statement such as "SELECT static-memory.name".

Information regarding the **tables** (and **aliases** of **tables**) in the relational database 250 to select data from is inserted in the < **tables** and **aliases** > section of the SQL commands 261.

In a preferred embodiment, the information regarding the **tables** and **aliases** comprises a sequence of **tables** and **aliases** of **tables** to be joined from the relational database 250 into a single joint table to be searched. The choice and order of the **tables** and **aliases** to be joined is retrieved from the ...AND" statement where there are multiple conditions) which must be met by records selected from the relational database 250. The choice and order of the conditions to be met is retrieved from the condition records...

Patent Details:
Patent No Kind Lan Pg   Main IPC   Filing Notes
US 20030088548 A1   11 G06F-007/00

Abstract (Basic): US 20030088548 A1
        NOVELTY - The method involves examining a **joining** query and
    providing an **aliasing** list that indicates one field from a dimension
    table indicated in the **joining** query. An **alias** table is provided
    for the field in the **aliasing** list only if no other field from the
    dimension table is selected by the **joint** query. The **joint** query is
    transformed into a reduced query in which the **aliased** field values
    are replaced by the **alias** values.
        DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the
    following:
        (a) a query for use by a **database** manager in extracting
    information from a relational **database**
        (b) a **database** manager for extracting information from a
    relational **database** in response to a **joining** query.
        USE - Used for extracting information from a relational **database**
    in **database** managers.
        ADVANTAGE - The method decreases the processing time even when the
    volume of data in the data manager is large and reduces the
    requirements for **joins** in the query statement.
        DESCRIPTION OF DRAWING(S) - The drawing shows a flowchart of the
    information extraction method.

Abstract (Basic): US 20010047364 A1
    NOVELTY - A compound structure having a rack with horizontal
arrangement of target structures linked by an **alias** backbone
representing a dimension of information, is established and referenced
to obtain associated information. The horizontal arrangement of target
structures selectively include compound and base structures containing
data, in different combinations.
    DETAILED DESCRIPTION - An INDEPENDENT CLAIM is also included for
computer readable memory storing data organizing program.
    USE - In client-server computer network for organizing data in
database for on-line analytical processing, to analyze businesses and
organizations.
    ADVANTAGE - Allows versatile, tunable, flexible and space efficient
multi-cubes to be **joined** into compound structure that can be easily
changed, comprehended and manipulated independently. Provides
completely scalable and adaptable infrastructure, and improves
processing efficiency.

   Journal Announcement: 8908
   Abstract: The authors extend distributed **database** query optimization
techniques to support a **database** programming language, a language much
richer than relational query languages. With the richness comes
difficulties, e.g., how to recognize **joins** and how to handle **aliases** . A
description is given of the following techniques: dataflow analysis,
abstract evaluation, partial evaluation, and rewriting. Also, the authors
overview the algorithm that uses these techniques. 53 Refs.

...   in that database as if they were dBASE tables in a directory.
First, use SET **DATABASE** TO <alias> to link to the **database** , and then
issue the USE <anytable> command, which is very familiar to Xbase
programmers. USE...

...CGI example, dBASE permits using either SQL or dBASE command syntax
against either a local **database** or a SQL server. This capability applies
to both data definition and data-processing operations...

...discover a trick that made working against either type of table
transparent: Create a BDE **alias** for local **tables** just as you must do
for server tables. Once you have done this, you can issue the SET **DATABASE**
 TO < **database** > command to activate either a local or a SQL **database** ,
and you can perform heterogenous operations by including the **database**
alias in your command. For instance, to **join** a dBASE table to a SQL
server table, you would construct a select that looks...

...a transaction with the BEGINTRANS( ) function; the first parameter
indicates the BDE alias of the **database** in which the transaction is to be
performed, and the second indicates the transaction isolation level. You
can program transactions for local **tables** by specifying an **alias** that
points to a directory in which dBASE or Paradox tables are stored. The
transaction...

...   data access in the new Borland desktop applications occurs via
BDE/IDAPI, switching from desktop **databases** to SQL servers should be
transparent.
      BDE has an impressive list of features including bi...

...and support for either SQL or QBE queries against all data sources. It
also supports **database** aliases that provide a powerful metaphor for
pointing to **databases** .
      The key to Borland's upsizing strategy is to make use of existing
development resources...
...dBASE commands against SQL data without learning the SQL paradigm.
      Also, by letting developers reference **tables** by **aliases** set up
using the IDAPI utility, dBASE makes it easier to develop an application
using test data in local tables, and later deploy it using a SQL **database**
server. Applications (theoretically) can be ported by merely changing the
aliases. Although this is true...

...Nevertheless, aliases go a long way toward easy migration.
      Concurrent and transparent access
      The Borland **Database** Engine lets dBASE for Windows concurrently
connect to and **join** dBASE IV, Paradox, and ODBC data sources, as well as
Oracle, SYBASE, and InterBase SQL...

...   to physically copy data from its primary site to other sites
automatically.
      As client/server **databases** grow in popularity, size, and geographic
distribution, a variety of new issues arise. In theory, you could
distribute **databases** to different nodes of a wide area network and have
realtime access to any data...

...They've created data definition language (DDL) and system catalog
entries to define and manage **aliases** and addresses. A " **table** " in a
SELECT statement can be defined locally, or it can be an **alias** for a
table at another address, i.e., on another server. Oracle can even handle
remote heterogenous **joins** (e.g., **joining** an Oracle table in New York
with a DB2 table in Chicago) although these capabilities...

...a separate product, OmniSQL Gateway and The Ask Group has Star, which
supports remote heterogenous **joins** .
      Several practical considerations have led many system architects to
design data duplication into their systems...

...these problems is replication services. Replication servers can be used
to move data from one **database** to another in an automated way. Using
SQL-like syntax, you can "subscribe" or "register...
